

Leaf Separator

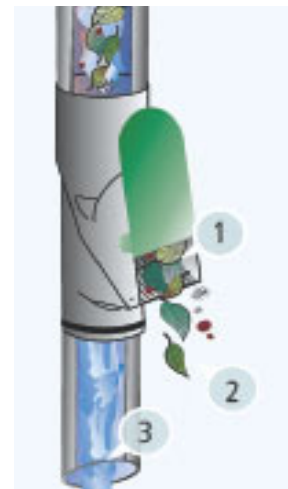

The Leaf Separator is placed in the downspout to remove particles and debris from water collected from rooftops. If you have a home with many trees and leaves, you should select a Leaf Separator. It filters out leaves and larger debris particles then discharges them through the front opening on the filter. The green lid can be shut in winter conditions. Accumulating leaves and particles are continuously filtered out, reducing the need to clean gutters and downspouts yourself. The Leaf Separator can be installed on downspouts ranging between the sizes of DN80 (3in.) and DN100 (4in.), and the adapters are included.

- Works well as a pre-filter for a rainwater harvest tank
- Accepts high volume of water flow
- Perfect for outdoor water use, the larger dirt is filtered out of the rainwater by the filter ribs
- Compact filter for use when there is little room to work with

Product Depth	9.64"
Product Height	13.00"
Product Width	8.50"

Material Polyethylene

How It Works:

1. Larger debris is filtered out of the rainwater by ribs or cascades.
2. Leaves and debris are simply washed out the front of the filter.
3. Filtered rainwater passes through the downpipe.
